No CS degree, fully self-directed. Yale Financial Markets (with Hons) · UPenn Quantitative Modelling · Corporate Finance · UIUC Financial Analysis, adding a strong FinTech AI domain edge.

PROFILE SUMMARY

RAG Systems LLM Orchestration Multi-Agent Pipelines Vector Search Workflow Automation FinTech AI

AI Engineer with production freelance experience at **Tensorlake and Superteams AI**, building **Retrieval-Augmented Generation (RAG) pipelines, LLM applications, and multi-agent systems**. Open-source contributor to Agno (PR **merged to main**) and GirlScript Summer of Code (GSSoC) participant. Technical content reaches **2,000+ engineers** weekly; work recognised by Qdrant and the Agno CEO. IBM & Google certified in Python and Data Analytics; Yale Financial Markets (**with Honors**), establishing a strong FinTech AI domain edge. Self-directed: no CS degree, all output.

- **Currently shipping:** Production AI agents using LangGraph, Agno, and MCP, focusing on stateful orchestration, multi-agent coordination, tool-calling reliability, and real deployment patterns.

🌐 Projects & code → github.com/dvy246

FREELANCE ENGINEERING EXPERIENCE

Tensorlake

AI ENGINEER & TECHNICAL WRITER

LangGraph Agno Python Docker Tensorlake Indexing

- ▶ Architected a **stateful multi-agent research pipeline** using LangGraph and Tensorlake's indexing layer, implementing persistent state graphs and memory checkpointing to maintain full context across **10+ sequential tool-calling steps** per research session.
- ▶ Engineering and iteratively shipping an **agentic swarm system** on Tensorlake coordinating **5+ specialised sub-agents** for parallel document intelligence tasks, containerised via Docker for reproducible, environment-consistent deployment.
- ▶ Authored and published technical deep-dives on both systems across Medium, Dev.to, and Hashnode, driving developer awareness of Tensorlake's indexing capabilities to a **2,000+ engineer audience**.

Superteams AI

AI ENGINEER & TECHNICAL WRITER

Qdrant Python Sentence Transformers Cosine Similarity

- ▶ Designed and built a **Qdrant-powered molecular search pipeline**, generating sentence-transformer embeddings over molecular datasets and implementing cosine similarity retrieval in Qdrant for high-dimensional similarity search.
- ▶ Published a full architecture breakdown of the retrieval system, with the article **officially reposted by Qdrant**, validating production-grade engineering quality to their global developer community.

FEATURED PROJECTS

Article Generator: Multi-Agent System

Personal Project · github.com/dvy246

Agno Python LLM APIs Prompt Engineering

Multi-agent pipeline built with **Agno** that automates the full article lifecycle, where a **research agent** gathers topic context and sources, a **writing agent** drafts structured long-form content, and an **editing agent** refines tone, clarity, and formatting for a developer audience.

Financial Analyst Agent

Personal Project · github.com/dvy246

LangChain FastAPI Python RAG LLM APIs FinTech AI

AI agent system for financial analysis built with **LangChain** and served via **FastAPI**, processing financial statements, earnings reports, and market data through LLM reasoning to surface key metrics, generate structured analysis summaries, and answer domain-specific financial queries. Built at the intersection of agentic AI architecture and strong finance domain knowledge from B.Com (Hons), Yale Financial Markets (with Honors), and UPenn Quantitative Modelling, representing a genuinely rare combination for FinTech AI applications.

🔥 In Dev

Deep Research Agentic AI System

Personal Project · github.com/dvy246

LangChain FastAPI MCP Python RAG LLM APIs Embeddings

Agentic system built with **LangChain** and served via **FastAPI**, leveraging **MCP (Model Context Protocol)** for standardised tool integration, iteratively decomposing complex queries, retrieving and synthesising information across multiple sources, and producing structured research reports with organised findings and source attribution.

Data Science Team: Multi-Agent System

Personal Project · github.com/dvy246

Agno Python LLM APIs Multi-Agent Embeddings

Team-oriented multi-agent AI system built with **Agno**, coordinating specialised agents across distinct data science pipeline stages including data analysis, insight generation, and structured reporting. Designed around collaborative agent patterns where each agent owns a dedicated function within the shared workflow.

OPEN SOURCE & PROGRAMS

Agno: Unsplash Tool

Python · Agno Framework · API Integration

Contributed a native **Unsplash image-retrieval tool** to the Agno agentic framework, enabling agents to query and return images programmatically via the Unsplash API. PR reviewed and **merged to main** by Agno maintainers; live for the full community.

✓ Merged

GirlScript Summer of Code

Open-Source Program · India

Active contributor in **GSSoC**, one of India's largest open-source contribution programs. Submitted reviewed pull requests, collaborated with project maintainers, and applied production-grade coding standards across real-world open-source repositories.
